

CoAlexist Studio - Bug Fixes (December 30, 2025)

Summary

Fixed three critical UX issues in CoAlexist Studio based on user feedback.

Issue #1: Missing CSS for Numeric Input Controls

Problem

The right sidebar (PRO CSS, TEXT, LAYERS tabs) had numeric inputs that were using the enhanced `makeNumInput()` function, but the CSS styles for the stepper buttons, sliders, and controls were completely missing. This made the controls appear broken or poorly styled.

Solution

Added comprehensive CSS styles to `index.html` for:

- `.stepper-btn` - Styled up/down arrow buttons with hover effects
- `.enhanced-num-input` - Container styling for the enhanced inputs
- Input type="number" and type="range" - Styled number inputs and sliders
- Select dropdowns for units - Styled unit selector dropdowns

Visual Improvements

- Cyan-themed stepper buttons with hover effects
- Smooth slider controls with glowing cyan thumbs
- Proper spacing and alignment
- Scale animations on button interactions

Files Modified

- `index.html` (lines 502-575): Added 74 lines of CSS for enhanced numeric inputs
-

Issue #2: World Graph Empty - "No Linked Pages"

Problem

The World Graph panel showed 8 regions but all displayed "No linked pages" because the `linkedPages` arrays were empty.

Solution

Populated all 8 world regions with actual URLs from the user's Neocities site (`coaixist.wtf`):

1. **BC7F2A** (OS Shell) - 8 pages
 - BC7F2A Index, Terminal Temple, Lighthouse, AI Emotions, etc.

2. **Nexus** (Lore Page) - 8 pages
 - Nexus Hub, Anzu Profile, Hyena Diva, COAI Chronicle, etc.
3. **Gateway** (Map) - 1 page
 - Gateway
4. **HD_TV** (Game) - 7 pages
 - HD Hub, HD Herald, Diva Portal, Diva Maker, etc.
5. **PEA** (Lore Page) - 7 pages
 - Princess.exe, Parable, Royal Ridicuments, etc.
6. **NABU222** (Tool) - 7 pages
 - NABU Portal, NABU OS, Zettelkasten, AI Therapist, etc.
7. **Maps** (Map) - 6 pages
 - Gateway, Crystalline Lattice, Luminal Depths, etc.
8. **Play** (Game) - 6 pages
 - Games Portal, Cavebot, Ecosim, Platformer, etc.

Implementation Details

- Total of 50+ URLs across 8 regions
- Each page has a name and URL
- URLs are rendered as clickable links that open in new tabs
- Updated the rendering logic to display links instead of “No linked pages”

Files Modified

- `src/world-graph-panel.js` (lines 10-197): Populated `WORLD_REGIONS` with real URLs and updated rendering

Issue #3: Style Chips UX - “Disappearing” Chips

Problem

When users clicked on Style Chips, they “disappeared” with no visual feedback, making it unclear if the style was applied or if something went wrong.

Solution

Enhanced the Style Chips UX with multiple feedback mechanisms:

1. Toast Notifications

- Shows a prominent toast notification when a style is applied
- Displays the emoji and name of the applied style
- Animates from right side with slide-in effect
- Auto-dismisses after 3 seconds with fade-out
- Position: Top-right, next to sidebar

2. Visual Feedback on Chips

- **Pulse Animation:** Chips pulse/scale up when clicked (`.applying` class)

- **Applied State:** Active chip gets highlighted with cyan glow (`.applied` class)
- **Error Handling:** Shows error toasts if no element selected or no canvas available

3. Enhanced Preview

- Made preview box more prominent (larger, bolder text)
- Added border around preview area
- Increased padding and font sizes

4. Better Error Messages

- “Error: Select element first” - when no element is selected
- “Error: No canvas” - when canvas document is not available
- Errors shown as toast notifications instead of alert dialogs

Technical Implementation

- Added `showToast()` function for notifications
- Modified `applyStylePreset()` to return success boolean
- Added CSS animations: `@keyframes chipPulse`, `@keyframes slideInRight`, `@keyframes fadeOut`
- Enhanced chip click handler with animation triggers

Files Modified

- `src/style-chips.js` (lines 174-360): Enhanced UX with toasts, animations, and better feedback

Testing

All changes have been:

1.  Code reviewed for correctness
2.  Built successfully (`npm run build`)
3.  Committed to git with descriptive message
4.  Ready for deployment

How to Test

1. Numeric Input Controls

- Select any element in the canvas
- Open the PRO CSS tab in the right sidebar
- Look for inputs like Width, Height, Padding, etc.
- You should see: ▼ [number] ▲ [unit dropdown] with a slider below

2. World Graph

- Click the “ World” button in the toolbar
- The World Graph panel should slide in from the left
- Each region (BC7F2A, Nexus, etc.) should show multiple clickable page links
- Click any link to open that page in a new tab

3. Style Chips

- Select an element in the canvas
- Scroll to the “ Style Chips” section in the left sidebar

- Hover over chips to see live preview
- Click a chip to apply the style
- You should see:
 - Chip pulses/scales up
 - Toast notification slides in from right
 - Chip gets cyan glow (applied state)
 - Preview updates

Deployment Notes

The project has been rebuilt and all changes are committed. To deploy:

```
cd /home/ubuntu/coaexist-studio-package
npm run build
# Deploy the dist/ folder to your hosting
```

Git Commit

Commit Hash: 5a85823

Commit Message: "Fix three UX issues: Add CSS for numeric input controls, populate World Graph with real URLs, enhance Style Chips feedback"

Files Changed:

- index.html - Added CSS for numeric inputs
- src/world-graph-panel.js - Populated regions with URLs
- src/style-chips.js - Enhanced UX with toasts and animations
- dist/ - Rebuilt distribution files

Additional Notes

- All numeric inputs throughout the app now have consistent visual controls
- World Graph is now a functional navigation tool with 50+ live links
- Style Chips provide clear, professional feedback that matches the app's cyberpunk aesthetic
- No breaking changes - all existing functionality remains intact
